Summary interpretation:

Analysis of the feed samples reveals considerable variability in nutritional profiles. While some batches demonstrate good energy (ME up to 4020 kcal/kg) and protein content, others exhibit critically low protein levels (as low as 1.34%), indicative of severe nutritional inadequacy or potential misclassification, rendering them unsuitable for standard livestock feed without significant supplementation. Elevated moisture in certain samples (up to 17.6%) poses a spoilage risk. High ash content in some suggest potential mineral imbalances or contamination. This wide range implies inconsistent quality control or diverse feed types requiring careful application to avoid deficiencies or safety concerns.

JaaGee Application, Training & Research Laboratory engages in nutritional analysis, microbial, and various chemical analysis to improve the quality and healthiness of foods and feeds.
